

WEB-BASED STRATEGIC CLIENT PLANNING SYSTEM FOR END-USER CREATION OF QUERIES, REPORTS, AND DATABASE UPDATES

ABSTRACT

A method and program storage device for creating tabular data stream flow for sending
5 rows of secure data between a client workstation and a server computer over a network using a
common object request broker architecture (CORBA). This method includes receiving a request
to create a query form at the client workstation, receiving a worksheet grid form defining selected
tabular data, and packaging the worksheet grid form representing an updated status of the data for
the tabular data stream flow.
